Key Findings:	3
Snyk Findings (SCA)	7
Sonarqube Findings (SAST)	8
Appendix I – Security Automation and Recommendations	8
Pre-commit Hooks	8
Recommendations:	8

Executive Summary

The Executive Summary outlines the key findings derived from the SCA (Software Composition Analysis) and SAST (Static Application Security Testing) scans conducted on the application repository, as well as the results observed during runtime testing. It provides an overview of the key security and vulnerability issues identified, with a breakdown of the SAST and SCA scan results included in the summary. Detailed findings, including specific vulnerabilities and their potential impact, will be addressed in the Findings and Recommendations section for further review and action.

Risk Assignment

Testing discovered a total of 7 unique findings. After a thorough analysis, these findings have been rated at the following risk levels:

Key Findings Summary:

RISK LEVEL	COUNT
CRITICAL	3
HIGH	1
MEDIUM	2
LOW	1

Key Findings by Class and Severity:

Finding	Severity
SQL Injection Vulnerability	Critical
Unrestricted File Uploads	Critical
Exposed and Hardcoded Secret Key and	Critical
Password	
Log files exposure and insecure logging	High
(/logs Route)	
Broken Access Control (/users Route)	Medium
Insecure Template Rendering	Medium
Project Dependency File must contain	Low
version limitations	

Software Composition Analysis (SCA):

Critical	High	Medium	Low
0	1	0	1

Static Application Security Testing (SAST):

Critical	High	Medium	Low
0	1	0	0

Risk Rating are calculated $\underline{using\ CVSS\ Version\ 3.1\ Calculator}$

Scoring Matrix: https://nvd.nist.gov/vuln-metrics/cvss

Vulnerability Assessment

No file size limit

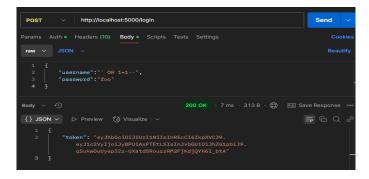

Key Findings:

Risk Level	Critical
Vulnerability Class	SQL Injection Vulnerability
CVSS v3.1 Rating	9.2 (AV:L, AC:L, PR:N, UI:N, S:U, C:H,I:L, AH)
Location http://localhost:5000/login	
Description	

Query is not parameterized and easy for attacker to pass in SQLi attack. Worst case scenario is access to an admin account that has full access to the app resources such as database and server configuration.

Evidence

Steps to replicate: Send an HTTP **POST** Request to http://localhost:5000/login with payload: {"username":" OR 1=1--","password":"foo"}

Recommendations	 Use parameterized query to prevent SQL injection: conn = get_db()
	query = "SELECT * FROM users WHERE username=? AND password=?"
	user = conn.execute(query, (username, password)).fetchone()
	Add firewall SQLi injection protection.

Affected Compliance Control	SOC 2 Type 2: Criterion CC3.1 (Risk Mitigation)
	ISO 27001:2022: Control A.8.28 (Secure Coding)
	ISO 27001: 2022 Control A.8.27 (Secure system architecture and
	engineering principles)
	ISO 27001:2022: Control A.8.5 (Secure authentication)

Risk Level	Critical
Vulnerability Class	Unrestricted File Uploads
CVSS v3.1 Rating 9.2 (AV:L, AC:L, PR:N, UI:N, S:U, C:H,I:L, AH)	
Location	http://localhost:5000/upload
Description	
 No file type validation. Attacker can upload malicious files since the endpoint is not restricting any file types. No file upload limit set. Attacker can send a large volume of file upload request to overload the server's resources. 	

Recommendatio

ns

Evidence Steps to reproduce: Try upload multiple files with different file types. Risk Level	Medium			
Vulnerability Class	Broken Access Control (/users Route)			
CVSS v3.1 Rating	5.0 (AV:L, AC:H, PR:H, UI:N, S:C, C:L,I:L, AL)			
Location	http://localhost:5000/users			
Description				
 Users table or information should not be available to public. User information can be used in various types of attacks. (e.g. Phishing) Roles are sensitive because they define the level of access a user can do and can be identified and targeted. 				
Evidence				
_				

engineering principles)

Risk Level	Medium			
Vulnerability Class	Insecure Template Rendering			
CVSS v3.1 Rating	5.0 (AV:L, AC:H, PR:H, UI:N, S:C, C:L,I:L, AL)			
Location	http://localhost:5000/template			
	Description			
Cross Site Scripting (XSS)	Cross Site Scripting (XSS) Vulnerability			
Attacker can push malicio	us Script/HTML payload and render it to the users			
	Evidence			
Steps to reproduce:				
Run the app.				
Access Location URL and pass a p	arameters template with URL encoded value of a link			
← → C				
Malicious Link				
Recommendations	If it is really necessary to allow users to upload template, add			
	input encoding and validation.			
	Add firewall rules to detect XSS injection.			
References	https://owasp.org/www-community/attacks/xss/			
Affected Compliance Control	ISO 27001:2022: Control A.8.27 (Secure system architecture and			
	engineering principles)			
	ISO 27001:2022: Control A.8.28 (Secure Coding)			
	(2226,			

Risk Level	Low		
Vulnerability Class	Project Dependency File must contain version limitations		
CVSS v3.1 Rating	3.9 (AV:L, AC:H, PR:H, UI:N, S:C, C:N,I:L, AL)		
Location	https://github.com/TableCheck-Labs/tablecheck-security-take-		
	home/blob/main/app/requirements.txt		
Description			
Although this not a high risk it's best practice to define versions of the dependencies. Declaring non			
versioned dependencies may lead to engineers installing a vulnerable version of it.			
Evidence			
SCA findings in Snyk:			

Snyk Findings (SCA)

Software Composition Analysis by **Snyk** (Free version)

Risk Level	High			
Vulnerability Class	werkzeug Remote Code Execution (RCE)			
CVSS v3.1 Rating	7.5			
Location	https://github.com/TableCheck-Labs/tablecheck-security-take-			
	home/blob/main/app/requirements.txt			
Description				
Affected versions of this package are vulnerable to Remote Code Execution (RCE) due to insufficient hostname checks and the use of relative paths to resolve requests				
Evidence				
H werkzeug - Remote Code Execution (RCE) 𝒞				
VULNERABILITY CWE-94 ** CVE-2024-34069 ** CVSS 7.5 ** HIGH SNYK-PYTHON-WERKZEUG-6808933 **				
Recommendations	Update the version to 3.0.6			
References	https://cwe.mitre.org/data/definitions/94.html			
	https://www.cve.org/CVERecord?id=CVE-2024-34069			

Risk Level	Low		
Vulnerability Class	zipp Infinite loop		
CVSS v3.1 Rating	6.9		
Location	Requirements.txt		
Description			
Infinite loop where an attacker can cause the application to stop responding by initiating a loop through			
functions affecting the Path module, such as joinpath, the overloaded division operator, and iterdir.			
Evidence			

Sonarqube Findings (SAST)

Risk Level	High			
Vulnerability Class	Cross-Site Request Forgery (CSRF)			
CVSS v3.1 Rating	7.0 (AV:L, AC:H, PR:L, UI:N, S:U, C:H,I:L, AH)			
Location	арр.ру			
	Description			
No CSRF configuration ena	abled for Flask App			
 Prone to CSRF Attack whe 	re attacker force users to perform malicious actions to thei	ir account.		
https://owasp.org/www-community/attacks/csrf				
	Evidence			
app = Flask(_name_)				
Make sure disabling CSRF protection is safe here.				
<pre>app.config['SECRET_KEY'] = 'dev-secret-key-123' app.config['UPLOAD_FOLDER'] = 'uploads'</pre>				
Recommendations	 Set the CSRF configuration WTF_CSRF_ENABLEI and add logic to you code to use CSRF tokens. It is recommended to not disable the CSRF proteins. 			
	specific views or forms:

	https://cwe.mitre.org/data/definitions/79.html			

Appendix I – Security Automation and Recommendations

Pre-commit Hooks

These hooks are great way to enforce security controls at the early development phase. Here are the recommended pre-commit hooks:

- Secret Scanning Prevents engineer from committing hardcoded secret to the repo.
- Static Analysis (e.g pylint) Catches common security flaw in the code.

Recommendations:

Although there are many pre-commit hooks available, I recommend using the ones above as the minimum controls. This is because SAST and SCA tools can be integrated into the repo pipelines, allowing security personnel to track the status of these vulnerabilities. Below are the use cases and DevSecOps tools I recommend.

Static Application Security Testing (SAST):

 SonarQube is an open-source tool that can be self-hosted. It is highly effective at detecting code flaws, misconfigurations, and even identifying committed secrets. It can be integrated into the development pipeline to prevent branch merging when issues are detected.

Software Composition Analysis (SCA):

- o **Snyk (SCA)** A free tool provided by Snyk, it scans project dependencies to detect vulnerabilities. It also includes code analysis to identify committed secrets.
- Dependency-Track- This is an open-source tool that analyzes Software Bill of Materials, detect unsecure project dependencies and even detect dependency licensing issues.

DAST:

Owasp (ZAP) – Scans the project in the runtime stage. And detects security issues and configuration.

• All in one DevSecops Tool:

 Akido: An all-in-one DevSecOps tool that can be integrated with other commonly used DevSecOps tools in the market, such as SonarQube. Although it requires a license, it is highly powerful, featuring a denoise function that excludes false positive findings, allowing you to focus on critical vulnerabilities.
